

METHOD TO MAINTAIN THE INTEGRITY OF REMOTE DATA BY MAKING IT DISPOSABLE

Abstract of the Disclosure

In a networked system having a protected central server network connected to one or more satellite servers, the central server includes master data, and each satellite system includes replicated data derived from the master data. A corruption of at least a portion of the replicated data in one of the satellite servers is determined. Responsive to determining the corruption, at least the corrupted portion of the replicated data is replaced in the satellite server with data derived from the master data of the central server.
